Customization and automation of the 2D drawing environment is done through objects and commands available in the drawing window. The drawing window contains these tools. Commands can be used to do a number of tasks including moving objects on the drawing canvas, creating, editing, deleting, and positioning objects. A command is a set of options, a number, or command, and an action. There are two types of commands: active and inactive. An active command is active while it is in memory. Commands are managed using queues. A queue is a list of commands. A command's parameters are stored on a per-queue basis. A queue allows one command to have access to parameters when the command is ready to be executed. A command will move to the top of the queue if it cannot find the parameters it needs to run. Commands can set a context object, which is a data structure that can be used by a number of commands for information. Key functions of the Autodesk application architecture include: File formats All operating systems come with a native support for AutoCAD Product Key, including Windows, Mac, Linux, Solaris, HP-UX, and AIX. AutoCAD drawing formats are the AutoCAD DWG (Drawing XML) and DXF (Drawing Exchange Format). The DWG format allows importing and exporting drawings using the native drawing program, but the DXF format is limited to the native AutoCAD only. AutoCAD 3D is based on the native 3D native DWG format. The DXF format is also supported in the native application. AutoCAD 2008 has native support for DWGX. A cost-effective method to reduce livestock methane emissions was sought by examining the energy efficiency of New Zealand beef breeds. The energy efficiency was determined using a comparative feeding value and on-farm methane mitigation analysis. A 15% improvement in net energy efficiency was found for Brahman over Angus cattle. An improvement in net energy efficiency of 40% over grain fed Angus and 22% over grain fed Bonsmara was observed. Grass fed Brahman were the most energy efficient when compared with grass fed Brahman and Bonsmara. On-farm methane mitigation of methane produced per MJ of dietary DM energy was found to be the greatest for Angus, followed by Brahman and Bonsmara. The feeding value and net energy efficiency findings have shown that New Zealand beef cattle have potential to be used as an energy efficient alternative for livestock feed in New Zealand.Universitat Sant Lluc Univers

Scalable Vector Graphics (SVG) is a vector graphics format defined by the World Wide Web Consortium (W3C). It is designed to describe two-dimensional graphics, including logos, icons, diagrams, and images. In addition to the graphical elements, SVG specifies the text used to label each element. It is meant to describe the actual visual elements (shape, color, etc.) as well as the appearance of the elements (e.g., by using typography). According to W3C, the purpose of SVG is to "make it easier for people to create, edit, and view graphics online and on mobile devices and to share them across the Internet." SVG provides the ability to display graphics with text labels. And not only this but also it makes graphics scalable, allowing them to be viewed at any size. Using this method, the image you see is a pixel-based image, but the text and elements within are vectors that appear exactly as you design them. An SVG file is like a blueprint for the artwork you see. The actual object created and displayed can be viewed at any size, so the only scaling needed is for your final printed or displayed artwork. You can use SVG in two different ways: You can design the SVG file and insert it into the template you'
